

ENVIRONMENTAL PRODUCT DECLARATION

CEMENT MORTAR FOR TILE INSTALLATION

INDUSTRY-WIDE REPORT

PRODUCTS MANUFACTURED IN NORTH AMERICA

This Environmental Product Declaration, provided by Tile Council of North America (TCNA) and its members, contains a comprehensive environmental analysis of approximately 2 billion kg of mortar produced in North America.

This is an industry-wide EPD facilitated by TCNA with participation from the following companies:

- Ardex
- Bexel
- Bostik
- Crest
- Custom Building Products
- HB Fuller/TEC
- Interceramic
- Laticrete
- MAPEI
- Cemix/Texrite

Established in 1945 as Tile Council of America (TCA), TCNA is recognized for its leadership role in promoting the use of ceramic tile, conducting independent research and product testing, and developing industry standards.

ENVIRONMENTAL PRODUCT DECLARATION

NORTH AMERICAN CEMENT MORTAR FOR TILE INSTALLATION
AS DEFINED BY ANSI A118.1, ANSI A118.4, ANSI A118.11, AND ANSI A118.15

According to ISO 14025

This declaration is an environmental product declaration (EPD) in accordance with ISO 14025. EPDs rely on Life Cycle Assessment (LCA) to provide information on a number of environmental impacts of products over their life cycle. Exclusions: EPDs do not indicate that any environmental or social performance benchmarks are met, and there may be impacts that they do not encompass. LCAs do not typically address the site-specific environmental impacts of raw material extraction, nor are they meant to assess human health toxicity. EPDs can complement but cannot replace tools and certifications that are designed to address these impacts and/or set performance thresholds – e.g. Type 1 certifications, health assessments and declarations, environmental impact assessments, etc. Accuracy of Results: EPDs regularly rely on estimations of impacts, and the level of accuracy in estimation of effect differs for any particular product line and reported impact. Comparability: EPDs are not comparative assertions and are either not comparable or have limited comparability when they cover different life cycle stages, are based on different product category rules or are missing relevant environmental impacts. EPDs from different programs may not be comparable.

NORTH AMERICAN CEMENT MORTAR FOR TILE INSTALLATION
AS DEFINED BY ANSI A118.1, ANSI A118.4, ANSI A118.11, AND ANSI A118.15

According to ISO 14025

Tile Council of North America (TCNA)

TCNA is a trade association representing manufacturers of ceramic tile, tile installation materials, tile equipment, raw materials, and other tile-related products. Through its Green Initiative, TCNA and its members are industry leaders in distinguishing and communicating the sustainability and environmental attributes of ceramic tile and related installation materials by conducting research, developing educational programs, and providing a forum through which TCNA members can be active in the green building community.

Information in this document has been coordinated by TCNA's technical staff based on information submitted by leading North American tile mortar manufacturers. The life cycle data and product information presented herein are representative of a range of mortar products from the following manufacturers:

Product Definition

Product Description

Cement mortar for tile installation is a blend of cement, very finely graded sand, and water retention compounds that allow the cement to properly hydrate. Its primary function is to adhere tile to a substrate, and it may contain polymers or other additives to improve adhesion, accommodate movement, and add strength.

NORTH AMERICAN CEMENT MORTAR FOR TILE INSTALLATION
AS DEFINED BY ANSI A118.1, ANSI A118.4, ANSI A118.11, AND ANSI A118.15

According to ISO 14025

Although there are many ways cement mortar can be used to install tile, most commonly today this is achieved by applying the cement mortar with a notched trowel to a pre-fixed substrate, pressing tiles into the mortar, and allowing the system to cure for a specified amount of time. The following are the most common classifications of cement mortar products used in this way:

- Dry-set cement mortar, defined per ANSI A118.1
- Modified dry-set cement mortar, defined per ANSI A118.4 and ANSI A118.11
- Improved modified dry-set cement mortar, defined per ANSI A118.15

Additionally, a variety of cement mortars for tile installation may be classified by ISO 13007 – Terms, Definitions and Specifications for Ceramic Tile Grouts and Adhesives.

Performance criteria for each of the above classifications of cement mortar for tile installation, including set time and open time, shear strength to various types of tiles, floor test performance, and sag resistance, are established by their respective standards.

As is the case with tile, cement mortar is capable of withstanding a wide range of environmental stresses. Once cured, it is durable, fire- and heat-resistant, non-combustible, non-sensitive to moisture, and maintenance-free.

Range of Applications

Mortar products are commonly used in interior, exterior, commercial, institutional, and residential tile installations.

Product Standards

The products considered in this EPD meet or exceed the following Technical Specifications:

- ANSI A118.1 – American National Standard Specifications for Dry-Set Cement Mortar
- ANSI A118.4/11 – American National Standard Specifications for Modified Dry-Set Cement Mortar
- ANSI A118.15 – American National Standard Specifications for Improved Modified Dry-Set Cement Mortar
- ISO 13007 – Terms, Definitions and Specifications for Ceramic Tile Grouts and Adhesives.

Additionally, some cement mortar for tile installation considered in this EPD have been certified to meet the following Sustainability Specification:

- ANSI A138.1 – Green Squared® American National Standard Specifications for Sustainable Ceramic Tiles, Glass Tiles, and Tile Installation Materials

Fire performance: cement mortar is non-flammable and non-combustible.

No environmental burdens are expected for unforeseen flooding or mechanical destruction.

Information on leaching performance: No industry-wide data available as this EPD represents a broad range of cement mortar products. Consult with manufacturers and/or reference product-specific EPDs for additional information.

NORTH AMERICAN CEMENT MORTAR FOR TILE INSTALLATION

NORTH AMERICAN CEMENT MORTAR FOR TILE INSTALLATION
AS DEFINED BY ANSI A118.1, ANSI A118.4, ANSI A118.11, AND ANSI A118.15

According to ISO 14025

Mortar Production

Figure 1: Process flow diagram for cement mortar (for tile installation) manufacturing

Raw materials, including cement sand, calcium carbonate and other modifiers are unloaded and temporarily stored. When needed for production, materials are retrieved from storage, placed into specific batches based on formulation, dry-mixed, and then placed into packaging (usually bags). Packaged materials are then palletized, subjected to quality assurance inspections, placed into warehouse storage, and finally shipped to customer warehouse or job site. All manufacturers of products represented by this EPD are governed by federal and local requirements for dust control. Where applicable, they have incorporated dust collection systems in their processes to optimize material usage and mitigate airborne dust and particulate matter within the factory.

Production Waste

The vast majority of scrap and waste is recycled back into the product. A few sites produce a small amount of waste, the disposal of which is included in system boundaries. Where applicable, dust emissions during the mixing of the mortar are collected through a dust collection system and recycled back into the production line.

NORTH AMERICAN CEMENT MORTAR FOR TILE INSTALLATION
AS DEFINED BY ANSI A118.1, ANSI A118.4, ANSI A118.11, AND ANSI A118.15

According to ISO 14025

Manufacturers of cement mortar for tile installation offer varieties of products with pre- and post-consumer recycled content. This can contribute to overall building recycled content and help achieve compliance with recycled content targets in green building projects. Additionally, high levels of responsibly recovered waste, including dust and powder, are commonly reincorporated into mortar manufacturing. Waste reclamation in such processes is a vital component to minimizing waste and maximizing resources. In fact, most mortar factories included in this study are so efficient at waste reclamation, they are effectively closed loop facilities. Reducing waste to zero and fully utilizing all inputs is paramount to efficient manufacturing.

Delivery and Installation of the Mortar

Delivery Status

For purposes of this study, the average transport distance from manufacturing to construction site was assumed to be 500 miles (805 km) by truck. The cementitious mortars included in this study are most commonly packaged in composite, plastic, or paper bags in units of 50 lbs.

Installation

Cement mortar for tile installation is primarily installed by hand, with potential limited use of machines to mix the mortar prior to application. Due to its material composition, mortar is typically quite alkaline and, as such, eye and skin contact should be avoided, especially for prolonged periods. In addition, precautions should be taken to reduce dust emissions and inhalation during installation. The installation safety instructions of a given mortar product should be followed during application. During installation, mortar is applied at approximately 0.833 lb. / ft.² (4.07 kg / m²) with around 4.5% of the total material lost as waste. Though some of this waste could be recycled, this scrap is modeled as being disposed of in a landfill.

Packaging

Primary packaging is either a paper/plastic composite, plastic, or paper bag, with secondary/tertiary packaging of shrink film and pallets. Packaging is assumed to be sent to landfill after installation. Landfill emissions from packaging are allocated to installation, while electricity generated from landfill gas (produced from the decomposition of bio-based packaging) is credited to the installation phase of the life cycle.

Use Stage

The service life of mortar is unique in that does not depend on the amount of floor traffic and the type and frequency of maintenance. Mortar is replaced only when the ceramic tile is replaced. Since tile is assumed to have a service life equivalent to that of a building's reference service life (RSL) (TCNA, 2014)—that is, 60 years—the mortar is thus assumed to also have a 60-year RSL.

The EPD must present results for the full 60 year RSL of the product, including the use stage impacts associated with that service life. Other scenarios such as the impacts for a 1-year service life or per m² of installed tile that are also of interest are included in the appendix.

NORTH AMERICAN CEMENT MORTAR FOR TILE INSTALLATION
AS DEFINED BY ANSI A118.1, ANSI A118.4, ANSI A118.11, AND ANSI A118.15

According to ISO 14025

Cleaning and Maintenance

Tile products should be cleaned routinely with tap water. However, as the mortar is completely covered by the installed tile and grout, it thus does not require cleaning or maintenance over its lifetime. As such, no cleaning or maintenance was modeled for mortar.

Prevention of Structural Damage

Tile should not be installed until any and all structural damage to the building has been adequately repaired and determined to be code compliant. Surfaces must be structurally sound, stable, and rigid enough to support the mortar, grout, and tile, in addition to any other ancillary tile installation products.

Health Aspects during Usage

Inherently, cement mortars do not emit VOCs. For polymer-modified cement mortars, the South Coast Air Quality Management District (SCAQMD) Rule #1168 details VOC thresholds that are most commonly specified. Cement mortars for tile installation represented by this industry-wide EPD are typically in compliance. Additionally, some products covered by this EPD have been engineered to minimize airborne dust or other job-site particulates. Some cement mortar for tile installation also has built-in mold and mildew protection to complement tile's inherent resistance to mold and mildew growth.

End of Life

As mortar is bound to the tile during application, it is typically disposed with the tile and as such, can be used in multiple applications—for example, clean fill material in land reclamation/contouring projects, base or substrate material for roadways and/or parking lots, replacement for raw materials used in cement or brick kilns, etc.

However, for purposes of this EPD, the analysis adopts the most conservative approach and assumes that 100% of all tile removal waste is disposed of in a landfill.

Life Cycle Assessment

A full life cycle assessment (LCA) was carried out according to ISO 14025 (ISO, 2011), ISO 14040 (ISO, 2009), and ISO 14044 (ISO, 2006), per the Product Category Rules (PCR) for Mineral Factory-made Mortar, as published by Institut Bauen und Umwelt e.V. (IBU, 2014), and the addendum as published by UL Environment (UL, 2016).

Declared Unit Description

The declaration refers to the declared unit of 1 kg of product.

X = declared module; MND = module not declared

Cut-off Criteria

No cut-off criteria were applied in this study. All reported data were incorporated and modeled using best available life cycle inventory (LCI) data.

Background Data

For life cycle modeling of the considered products, the GaBi ts Software System for Life Cycle Engineering (thinkstep, 2016), developed by thinkstep AG, was used to model the product systems considered in this assessment. All relevant background datasets were sourced from the GaBi 2016 database. The datasets from the GaBi database are documented in the online documentation (thinkstep, 2016).

NORTH AMERICAN CEMENT MORTAR FOR TILE INSTALLATION
AS DEFINED BY ANSI A118.1, ANSI A118.4, ANSI A118.11, AND ANSI A118.15

According to ISO 14025

Data Quality

A variety of tests and checks were performed throughout the project to ensure high quality of the completed LCA. Checks included an extensive review of project-specific LCA models, as well as the background data used.

Temporal Coverage

Primary data collected from TCNA members represent a consecutive 12 month averages during 2014 and/or 2015. Background datasets are primarily based on data from the last 5 years (since 2011), with the exception of cement, which dates from 2004.

Technological Coverage

Data on material composition and manufacturing are primary data from TCNA members. The raw material inputs, energy, waste, and emissions in the calculation for this LCA are based on annual purchases divided by annual production during the reference year.

Geographical Coverage

This background LCA represents TCNA products produced in the Canada, Mexico, and the United States.

Manufacturing energy representative for each country was included; proxy datasets were used as needed for raw material inputs to address lack of data for a specific material or for a specific geographical region. These proxy datasets were chosen for their technological representativeness of the actual materials.

Allocation

Co-Product Allocation

Where manufacturing inputs, such as electricity use, were not sub-metered, they were allocated by mass to the respective products produced at each facility. No other co-product allocation occurs in the product system.

Multi-Input Processes Allocation

No multi-input allocation occurs in the product system.

Reuse, Recycling, and Recovery Allocation

The cut-off allocation approach is adopted in the case of any post-consumer recycled content, which is assumed to enter the system burden-free. Only environmental impacts from the point of recovery and forward (e.g., collection, sorting, processing, etc.) are considered.

Product and packaging waste are modeled as being disposed in a landfill rather than incinerated or recycled. Plastic and other construction waste is assumed to be inert in landfills so no system expansion or allocation is necessary as landfill gas is not produced.

NORTH AMERICAN CEMENT MORTAR FOR TILE INSTALLATION
AS DEFINED BY ANSI A118.1, ANSI A118.4, ANSI A118.11, AND ANSI A118.15

According to ISO 14025

Interpretation

The CML 2001 (Apr. 2013) and the TRACI 2.1 life cycle impact assessment methodologies differ due to their distinct modeling approaches as well as to the regions they represent. Even so, both approaches find that the production of raw materials and energy for manufacturing are the two largest contributors in all impact categories considered. The installation of mortar is also a small but relevant contributor to abiotic depletion (fossil) and fresh water use. As raw material production and manufacturing are such large contributors to impacts in both impact assessment methods, the formulation of mortar would be the most effective area to focus burden reduction efforts.

These results do not constitute a comparative assertion, though architects and builders will be able to use them to compare TCNA's products with similar products presented in other EPDs that follow the same PCR.

HWD = Hazardous waste disposed; NHWD = Non-hazardous waste disposed; RWD = Radioactive waste disposed; CRU = Components for re-use; MFR = Materials for recycling; MER = Materials for energy recovery; EEE = Exported electrical energy; EET = Exported thermal energy

NORTH AMERICAN CEMENT MORTAR FOR TILE INSTALLATION
AS DEFINED BY ANSI A118.1, ANSI A118.4, ANSI A118.11, AND ANSI A118.15

According to ISO 14025

Results for 1 kg of installed mortar over a 1-year service life

As mortar requires no maintenance over its service life, the impacts of the life cycle of 1 kg of installed mortar over a 1-year service life are equal to the impacts of 1 kg of installed mortar over a 60-year service life, as presented in the body of this EPD.
